

Case Study: Linux System Log Analysis and Backup Automation

Scenario

You are a **Junior System Administrator** in a company that runs a Linux server.

Your tasks every day:

- Check **system logs** to find errors.
- Extract important information from logs.
- Store processed logs in a separate folder.
- Compress and archive the logs.
- Schedule the task to run automatically.
- Use Linux tools to edit, filter, analyze and automate.

You will use:

- File System commands
- Environment variables
- Basic commands
- User commands
- Filter commands
- GREP
- Processes management
- Compress and archive
- Job scheduling
- AWK / SED utilities
- CAT commands
- VI editor
