

Case Study: Employee Salary Processing System

Scenario

You are working as a **Linux administrator in a company payroll department**.

Every month, the HR team uploads an **employee salary file** with the following format:

```
EmployeeName Department BasicSalary
```

Input file:

```
Ravi IT 50000
Priya HR 45000
Arun Finance 40000
Divya IT 55000
Sanjay HR 42000
```

Your task is to create a shell script that:

- Reads employee salary data from a file.

- Calculates **bonus for employees**.

- Generates a **salary report**.

- Writes results to a report file.

- Uses loops and functions to process the data.

Sample Output:

```
cat salary_report.txt
```

Example output:

```
Employee Salary Report
```

```
-----
```

```
Ravi IT Basic:50000 Bonus:5000 Total:55000
Priya HR Basic:45000 Bonus:4500 Total:49500
Arun Finance Basic:40000 Bonus:4000 Total:44000
Divya IT Basic:55000 Bonus:5500 Total:60500
Sanjay HR Basic:42000 Bonus:4200 Total:46200
```

```
