

Case Study: Library Book Management System

Scenario

You are working as a **Linux administrator in a college library**.

The library maintains a file containing **book details** in the following format:

```
BookID BookName CopiesAvailable
```

Sample Input:

```
101 Linux 5
102 Python 8
103 Java 3
104 DataScience 6
105 Networking 2
```

Your task is to create a shell script that:

- Reads the book file.

- Checks availability of books.

- Generates a report of **low-stock books**.

- Uses loops and functions to process data.

- Writes output into a new report file.

Sample Output:

```
cat library_report.txt
```

Example output:

```
Library Book Report
-----
101 Linux 5 Status:Medium Stock
102 Python 8 Status:High Stock
103 Java 3 Status:Medium Stock
104 DataScience 6 Status:High Stock
105 Networking 2 Status:Low Stock
```
