

Case Study: Online Food Order Validation System

Scenario

You are working as a **Linux administrator for an online food delivery company**.

Customers place orders through the system. Your shell script should:

- Accept **order details from command-line arguments**.

- Validate the **food item**.

- Check **quantity limits**.

- Calculate the **total order amount**.

- Apply **delivery charges** based on conditions.

- Display the **final order summary**.

Concepts used:

- Shell environment

- Variables

- Operators

- Conditional statements
