

Case Study: Online Course Enrollment Processing System

Scenario

You are working as a **Linux administrator in an online learning platform**.

The system stores **student course enrollments** in a file with the following format:

```
StudentName CourseName Fee
```

Input file:

```
Ravi Python 5000
Priya Java 6000
Arun Linux 4000
Divya Python 5000
Sanjay Java 6000
```

Your task is to create a shell script that:

- Reads the enrollment file.

- Calculates **total revenue generated**.

- Identifies **popular courses**.

- Writes results to a report file.

- Uses loops and functions to process the data.

sample Output

```
cat course_report.txt
```

Example output:

```
Course Enrollment Report
```

```
-----
Ravi enrolled in Python Fee:5000 Type:Programming Course
Priya enrolled in Java Fee:6000 Type:Programming Course
Arun enrolled in Linux Fee:4000 Type:System Course
Divya enrolled in Python Fee:5000 Type:Programming Course
Sanjay enrolled in Java Fee:6000 Type:Programming Course
-----
```

```
Total Revenue: 26000
```
